Terminal East Expansion Project

Austin Bergstrom International Airport | 2012 – 2015

Page Architects, in coordination with the Austin Bergstrom International Airport (ABIA), obtained BNP's services to design and develop the baggage handling system elements of the new Terminal East Airport Expansion.

To allow for future growth the ABIA Terminal East Expansion Project is a unique initiative that responds to the planned additional demand by providing a new expanded FIS facility, additional passenger screening and ticketing operations, additional concession space as well as additional outbound and inbound conveyor and baggage handling system requirements to support the expansion.

To allow for a larger inbound demand and more passengers claiming baggage during the peak, BNP provided design services to increase the current claim capacity by lengthening two existing claim devices and installing a seventh in the existing baggage claim hall.

All inbound international flights would be processed in a new FIS facility in which BNP developed a claim device to accommodate two wide-body inbound flights in process at once. This claim utilizes two "negative-radius" turns to simultaneously conform to the unique shape of the East Infill FIS building as well as provide the required claim frontage to handle the anticipated international flights in process.
